

Symetrix’s Composer for Windows® software for the Edge, Prism, and Solus NX DSPs can natively control the Dante features of AudioScience’s Iyo Dante line of Mic+Line audio interfaces. Configuration, management, and control of the Iyo can be achieved without Dante Controller, including remotely identifying units, modifying device and stream names, and creating Dante subscriptions.

## 1 Add Iyo Dante to a Composer design

From the Composer Toolkit View, click Third-party Dante Devices > User Library > **Add New Dante Device**.

Click **Browse Network...**, then choose the desired Iyo type from the discovered devices list. Click **Select Hardware Unit**.
